COMMERCIAL FERTILIZERS.

I. OFFICIAL ANALYSES.

Since the publication of Bulletin No. 56, the following analyses have been made for manufacturers in compliance with the fertilizer law, and these fertilizers are now legally on sale in the State, in addition to those reported in the bulletin referred to above, except numbers 3185 and 3186, entered by the Chemical Co. of Canton, Baltimore, Md., for the year beginning Jan. 1st, 1896

The values for the "essential ingredients" for 1896 have not been changed and are as follows:

Soluble and reverted phosphoric acid in mixed fertilizers, 7 cents; in plain acid and unacidulated phosphates, 5 cents per pound.

Insoluble phosphoric acid in mixed fertilizers, $2\frac{1}{2}$ cents; in plain acid phosphates, nothing; in Orchilla guano, 3 cents; in other unacidulated phosphates, 2 cents per pound.

Phosphoric acid in fine bone, 4 cents; in medium bone, 3 cents per pound.

Nitrogen in all fertilizers, $17\frac{1}{2}$ cents per pound.

Potash in all fertilizers, from sulphate, 7 cents; from muriate, 6 cents per pound.

II—ANALYSES OF FARMERS' AND INSPECTORS' SAMPLES.

The law regulating the sale of commercial fertilizers in this State provides (Sec. 7) that: "Any agriculturist, a purchaser of any commercial fertilizer in this State, may take a sample of the same, under the rules and regulations of the Director of the said Experiment Station, and forward the same to the Experiment Station for analysis, which analysis shall be made free of charge." In the same section the Director is authorized, "In person or by deputy, to take samples for analysis from any lot or package of any commercial fertilizer which may be in the possession of any dealer in this State." Under these provisions, a number of samples have been analyzed from time to time and the results of these analyses are published in the following pages.

An examination of the table of analyses will show that most of the fertilizers sampled by farmers or by the Inspector are fairly represented by the samples sent to the Station by the manufacturers. Some are better than the official samples, while a few fall below them—not, however, to such an extent as to show any intention of fraud or gross carelessness on the manufacturers' part. Altogether the results are far more satisfactory than those of last year.

Here follows, first, a brief description of each sample; and, second, the analyses in tabular form. For convenience of reference, the "station number" of each sample is given, and all brands of the same manufacturer are arranged together. The names of the manufacturers are placed in alphabetical order in the description of the samples, and following each manufacturer's name are the brands of his make that were analyzed.

It is necessary to compare the analysis of each sample with the "official analysis" on the tags attached to the

sacks from which the sample was taken, because it is not possible for manufacturers to make the same fertilizer perfectly uniform from year to year, and any fertilizer is therefore liable to vary somewhat in composition; also, because the values assigned to the "essential ingredients" in calculating the "estimated value per ton" are subject to change from time to time. This is the reason why *a tag from one of the packages sampled must be sent with each sample for analysis.*

Explanations in Regard to the Table.

In the following table we have given in the first column the name of the brand ; next, where the sample was taken ; then the "station number," and, lastly, the analysis and valuation. The same order is preserved in the table as in the description of the samples, hence it is not necessary to repeat the name of the manufacturer. In the case of each brand, the official analysis is first given in *bold faced type*, for comparison. This official analysis is the same as the analysis that was on the tag attached to the sack from which the sample was taken.
